

R&D COLLABORATIVE PROPOSAL / **COMPANY PARTNER SEARCH**

The information you are about to provide in this form will be distributed among Spanish companies matching your company profile and that might be interested in the proposal of collaborative R&D project that you will be describing in this form. (Please use English language for filling in the document)

In the case that your company will establish a R&D project in collaboration with a Spanish company, you could present a Joint Project Proposal to the CHINEKA Program.

YOUR ENTITY PROFILE

Name: Universidad Autónoma de Madrid

Number of employees:

Annual turnover:

Balance Total:

Year of latest financial report:

Address: Ciudad Universitaria de Cantoblanco

City: Madrid

Province: Madrid

Postal Code: 28049

Telephone:

Fax:

Email:

WEB site: www.uam.es

Contact: Jorge Bedia

Position: Associate Professor

Telephone: 91 497 2911

Email: jorge.bedia@uam.es

Additional Contact: Carolina Belver

Position: Associate Professor

Telephone: 91 497 8473

Email: carolina.belver@uam.es

COLLABORATIVE R&D PROJECT PROPOSAL

(Describe as precisely as possible the technology cooperation proposal.
Describe what you have to offer and what you expect from your potential partner) Include: Sector Group; Abstract of Project; Innovations Offered; and Current State of Development

Title	Design of biochar based heterogeneous Fenton reagent for the in-site remediation of halogenated hydrocarbons in groundwater		
Duration (YM- YM)			
Budget (1,000 Euro)	SPAIN	CHINA	TOTAL
	200	400	600
Technology Field (Click a box)	<input type="checkbox"/> Smart Cities <input type="checkbox"/> Production Technologies, <input type="checkbox"/> Biomedicine and Technologies for Health, <input checked="" type="checkbox"/> Environment technologies <input checked="" type="checkbox"/> Clean Technologies <input type="checkbox"/> Modern Agriculture <input type="checkbox"/> Others		
Summary	<p>Our sector group is the research on Water Treatment by using Photocatalysis, an environmentally friendly technology able to use solar light as sustainable and clean energy source.</p> <p>Due to the complex hydrogeological conditions, the in-site degradation of halogenated hydrocarbons in groundwater is a challenge. In this context, the main objective of the project is the synthesis of biochar-based heterogeneous Fenton catalysts with high transportability and reactivity, long release period, and low environmental toxicity for the degradation of these halogenated hydrocarbons.</p> <p>The tasks of the project will be:</p> <ul style="list-style-type: none"> (i) Design and synthesis of iron/biochar catalysts and control their composition and structure to meet the request of halogenated hydrocarbons remediation in groundwater, (ii) Perform a complete characterization of the materials in order to establish the proper structure-performance relationships, (iii) Analyse the transportability of the catalysts as well as the adsorption and degradation mechanism of halogenated hydrocarbons, in groundwater will be studied by using a sandbox to model the real groundwater environment, (iv) Study the secondary pollution risk of both the iron-biochar catalysts and the reaction by-products of halogenated hydrocarbons will be tested by analyzing their acute and chronic toxic effects with a food chain model including bacterial and nematode. <p>The results of this project will provide a safe and effective solution for the remediation of halogenated hydrocarbons in groundwater.</p>		

SPANISH PARTNERS

(When you know a potential Spanish company, write its name and contact details in this section) Please, make a description of the desire type of Spanish Technology Partner.

We look for a Spanish Technology Partner involved in Water Treatment, interested in the develop of biomass derived catalysts for water treatment. Water-related firms with strong interest in investigation and development.

YOUR ENTITY DESCRIPTION

(Entity Website, Research and development guidelines, strategic alliances, competitive position, etc)

Our group belongs to the Department of Chemical Engineering at Autonomous University of Madrid (UAM):

https://www.uam.es/Ciencias/Seccion_InqQuimica/1446743210306.htm?pid=1242664085038. The Autonomous University of Madrid is part of the Campus of Excellence together with several CSIC entities, which has reinforced its leading position in the world's benchmark rankings, being currently the first Spanish university in the QS World University Ranking 2022.

Our research group has experience on research fields dealing with photocatalysis science and photocatalytic reactors engineering, environmental and energy technologies related to wastewater treatment and water splitting using solar light, and characterization of materials with special attention to electrochemical techniques. Our group is made up of four Associate Professor, three national and international PhD researchers and four PhD students from Spain and China.

Our research team usually applies to different cooperative and international projects and collaborate with international scientists. We have established strategic alliances with China, through the host programs from China Scholarship Council, with USA (Cincinnati University), Mexico (IPICYT) and Peru (Lima university) through international collaboration projects funding by Banco Santander-UAM programs. We have just participated in the Marie Curie call as supervisors of PhD researchers. We have also acquired a competitive position in Spain receiving funds from the State Investigative Agency through competitive calls. We have also established alliances with a Spanish enterprise through Technology Transfer Programs and contract signature. In the past six years, our scientific research fund reaches more than 0.5 million euros and Nearly 15 SCI papers are published every year. We are also involved in Editorial tasks as Editors of international journals with high impact factor, Chemical Engineering Journal (<https://www.journals.elsevier.com/chemical-engineering-journal/editorial-board/carolina-belver>) and Separation and Purification Technology (<https://www.journals.elsevier.com/separation-and-purification-technology/editorial-board/jorge-bedia-phd>).

Our cooperators in China are the working group in School of environmental and Chemical Engineering of Shanghai University (<https://ece.shu.edu.cn/>), led by an Academician of the Chinese Engineering Academy (Prof. Minghong Wu, who is also the Vice President of Shanghai University). Shanghai University is currently the 16th Chinese university in the QS World University Ranking 2022. The working groups are now leading 2 National Key Research Programs (60 millions yuan), and more than 10 National Research Programs (nearly 8 millions yuan). About 15 SCI papers are published each year, including ones published in Nature, Nature Chemistry and Nature Communication.

YOUR ENTITY PRODUCTS
(Technologies, applications, services, etc)

In last years, thanks to competitive R&D&I project and other projects with companies, the laboratories of the Chemical Engineering Department of the UAM have acquired the equipment to perform most of the activities considered in the project proposal, including the synthesis, characterization and testing of the materials in the photocatalytic processes investigated for water purification and hydrogen production.

We have the setups needed for the synthesis of photocatalysts, such as conventional and microwave heating, solvothermal synthesis and sol-gel. Similarly, most of the characterization techniques are available in the Chemical Engineering Department or in the "Interdepartmental Investigation Service (SIdI)" of the UAM (<https://www.uam.es/uam/sidi>). Including an electrochemical workstation for the characterization of some key features of the photocatalysts that will provide information about charge separation and recombination. The characterization techniques not available in UAM are available at the central services of other universities. For instance, SEM and TEM are available at University of Zaragoza or XPS that can be performed in the University of Extremadura.

We have also the equipment required for testing the activity and stability of photocatalysts under solar light. Two solar chambers are available to carry out the reaction under solar light, controlling reaction temperature and intensity of irradiation. We have a Liquid chromatograph (HPLC) for quantification of pollutants in water and a Gas chromatograph (GC) We have also access to other analytical techniques, such as Total Organic Carbon detector, for checking the mineralization of the pollutants, and Ionic chromatograph to study the effect of ionic species during the water treatment process.

Thanks to our Chinese partner we have access also to other techniques for understanding the mechanism of the degradation process, and to evaluate the toxicity of both real and treated wastewaters by inactivation of bacteria or other microorganisms, with access to testing equipment.
